

From email: "Skied the ramp outside of Bridger Bowl today, saw these small NE facing crowns at 8350'. We also experienced localized cracking while skinning at the density change interface of the new and "old" snow (8-12" at this elevation by 4pm). No other observed avalanches, no other cracking and no collapsing. New snow was sluffing easily on steep terrain." Photo: D. Sandberg

Advisory Region Bridger Range Longitude -110.93W Latitude 45.83N

Avalanche Details: Small Avalanches, Ramp Bridger Range, 2021-02-08
